

Greening Removals

Region 5

Emergency Response Branch

Climate Change

- EPA has many plans and tools in place
 - HQ, OSWER, Region 5 and R5 SFD
- ERB actions focus on:
 - reducing emissions
 - response to increased frequency and duration of flooding

Reducing Emissions

Green Removal Requirements

- Greener Cleanup Implementation Strategy requires:
 - GC training
 - GC language in all SFD contracts
 - GC Removal Requirements
 - Recycle consumables
 - Idle restrictions
 - Double-sided printing on recycled paper
 - Evaluate and document green activities

Green Activity Tracking

1. Complete Green BMP Planning Checklist before starting site
 - Submit to Green Coordinator

Appendix A continued		
Environmentally Preferred General Office Practices		
If a general category is not applicable, then check N/A for the category box, not for each subcategory.	Not Used	Comments Section Justify in the comments when applicable BMPs are not used. Cost Analysis, when performed and applicable, is a reasonable justification.
Energy		Comments
Use of Energy Efficient Equipment		
Programmable Thermostats	X	Utilized in site trailers
CFL or LED lights on Equipment	X	CFL bulbs utilized in site light strings
Heating, Cooling, & Fans (FEMP/Energy Star)	N/A	
Computer Equipment (FEMP/Energy Star)	X	START and ERRS printers Energy Star rated
Reduce Carbon Emissions from Transportation		
Use Internet Based Meetings/Conferences	X	EPA, START, and ERRS all utilize
Maximize Carpooling/ Public Transportation	X	ERRS utilized carpooling
Use of Local Labor/Suppliers (50 mile radius)	X	ERRS utilized local equipment rental
Email Small Files (less than 8 MB)	X	EPA, START, and ERRS all utilize
Reusable Electronic Storage Media or the Cloud	X	EPA, START, and ERRS all utilize
Water		
Use of Eco Friendly Toilets and Faucets	N/A	
Waste		
Reusable/Recyclable Packaging	X	Reconditioned 55-gallon metal drums utilized for waste removal
Minimize Packaging Material	N	Must comply with DOT Shipping rules
Recycle CFL and LED lights	X	EPA, START, and ERRS all comply
Use of Local Recycling Programs	X	Site recyclables collected/dropped-off
Use of Rechargeable Batteries	X	EPA, START, and ERRS all comply
Materials		
Printing when Required		
Double-sided Printing	X	Epson 845 printer is compliant
100% post-consumer recycled paper	X	Paper is 100% PCP
Use of Bio-Based Materials		
Bio-Based Ink	N	Unavailable for site printers
Bio-Degradable Cleaning Products	X	Used for site trailers
Environmentally Preferred		
Green Procurement		
Environmentally Preferred Vendors	N/A	
Purchase Supplies in Bulk	X	PPE, drinking water, waste totes
Liquids in Concentrated Form	X	Vet cleaning product

Green Activity Tracking

1. Complete Green BMP Planning Checklist before starting site
 - Submit to Green Coordinator
2. Track required metrics during removals
 - Include metric data in final POLREPs

Required Data Collection

Site		Metric	Amount used	Units
Greener Plating		Diesel Fuel Used		gallons
Greener Plating		Unleaded Fuel Used		gallons
Greener Plating		Alternative / E 85 Fuel Used		gallons
Greener Plating		Electricity from Electric Provider		kW
Greener Plating		Electricity from Other Sources		kW
Greener Plating		Solid waste reused		
Greener Plating		Soild waste recycled		
Greener Plating		Water Used		gallons

FY15 Metric Data- Fuel Use at Removal Sites

Using the Sun to Power Environmental Cleanup at the Pennsylvania Mine

EPA is using the sun to power cleanup work at the Pennsylvania Mine above Keystone, Colorado. In an effort to reduce the amount of toxic metals flowing into Peru Creek, a tributary to the Snake River, EPA is performing work to stabilize and prevent erosion of mine waste at the mine as well as supporting the Colorado Division of Reclamation, Mining & Safety in plugging mine tunnels to decrease the flow of metals-contaminated water. Usually this type of field operation involves running a diesel generator continuously to power and recharge tools, sampling devices, communication equipment and computers. At the Penn Mine EPA is using a solar powered generator with battery backup.

Plotted Superfund Sites Near or Within 100 & 500 Year Floodplains

Flood Preparedness

Goals for R5 SFD Emergency Response

- Increase program flexibility
- Assess programmatic resources/needs
- Develop/ centralize outreach materials
- Outreach
- Increase preparedness for responding under the National Disaster Recovery Framework

Flood Preparedness

Goals R5 Emergency Response

- Increase program flexibility
- Assess programmatic resources/needs
- Develop/ centralize outreach materials
- Outreach
- Increase preparedness for responding under the National Disaster Recovery Framework

National Response Framework

Flood Response- ESF 10 Tasks

- Respond to oil and hazardous materials (hazmat) releases and threats to the environment:
 - Detect and assess
 - Prevent, mitigate, minimize
 - Contain and stabilize
 - Collect, manage, and dispose
 - Clean up/decontaminate
environment, structures, buildings
- Develop site safety plan for oil/hazmat sites

National Response Framework

ESF 10 Tasks

- Collect/manage household hazardous waste
- Collect/manage Freon from white goods (Often via ESF 3)

National Response Framework

ESF 10 Tasks

- Debris support to USACE/states – *ESF #10 or ESF #3 subtask*
 - Air monitoring of debris operations/landfills
 - Landfill monitors to assure compliance with environmental requirements
 - Technical advice to USACE/states/locals on proper debris management/disposal
 - Review USACE/state/local debris management plans
 - Check debris piles for oil/hazmat contamination

Flood Preparedness

Goals R5 Emergency Response

- Increase program flexibility
- Assess programmatic resources/needs
- Develop/ centralize outreach materials
- Outreach
- Increase preparedness for responding under the National Disaster Recovery Framework

Resources Compiled

Internal Use

- Examples Documents:
 - Databases for tracking regulated facilities & contacts
 - HASPs
 - FEMA Mission Assignments
 - State Requests for Assistance
 - Hazard inventory forms
 - FEMA Flood Briefings
- Regulations
- Presentations, reports and OSC websites for past responses

Worksheet

STEP 1: Worksheet (page 1 of 2)

To better understand the threat of flooding, your utility should first examine historical flooding data and review Federal Emergency Management Agency (FEMA) Flood Maps. Below are instructions for evaluating the threat of flooding at your utility.

The tables below have sample data. Use the blank tables (double click icon) to input your utility's data.

1.1 Have you reviewed utility records of past flooding events? Yes No

If no, review how past flooding events have threatened your utility. Use various sources, including utility records, newspapers, websites and hazard mitigation experts, to collect previous flooding data. Enter your utility's past flooding information into Table 1.

EXAMPLE OF COMPLETED TABLE 1 - PAST FLOODING EVENTS

Event Information (e.g., Date, Name, Type, Flood Elevation)	Description of Damage (Operational, Public Health and Economic Impacts)
April 2007, "Patriot's Day Storm," Nor'easter, 238.5 ft	Collapsed water storage tank and damage to pump stations and chemical storage. Operated on backup power generator. Boil water notice issued for several days. Financial Impacts were roughly \$100,000.

* Tropical storm, hurricane, spring thaw/snowmelt, levee failure, etc.

1.2 What potential sources of flooding could impact your utility?

- Swollen rivers/streams
 Flash floods
 Levee/dam failure
 Spring thaw
 Coastal flooding
 Non-natural causes (e.g., main breaks)

1.3 Have you obtained FEMA Flood Maps? Yes No

If no, go to the [Map Service Center](#) to find FEMA Flood Maps, categorized by community. Flood Maps show areas that will be affected by both 100-year and 500-year floods. A "100-year flood" is a flood event that has a one percent chance of occurring in a given year. A "500-year flood" is a flood event that has a two tenths percent chance of occurring in a given year. Click on the icon to learn more about interpreting a Flood Map. If your Flood Map is not up to date, talk with your local community planning department or floodplain manager.

1.4 Identify which floodplains your utility systems are located within.

Locate your utility systems, such as intake, treatment, distribution, storage tank and pump stations, on your community's Flood Map to determine which floodplains they are located within. Summarize your findings in Table 2.

- Flood Resilience Guide
- Excellent risk assessment and planning tool

CLIMATE READY WATER UTILITIES

HIGH FLOW EVENTS AND FLOODING (DW) [Return to Introduction](#)

Intense precipitation events may occur more frequently, concentrating the annual total rainfall into episodes that may challenge current infrastructure for water management and flood control. When these protections fail, inundation may disrupt service and damage infrastructure such as treatment plants, intake facilities and water conveyance and distribution systems. Episodic peak flows into reservoirs will strain the capacity of these systems. Furthermore, inflow will be of lesser quality due to soil erosion and contaminants from overland flows, leading to treatment challenges and degraded conditions in reservoirs.

CLIMATE INFORMATION

- Since 1991, the amount of rain falling in very heavy precipitation events has been above average across most of the United States (USGCRP 2014). This observed trend has been greatest in the Northeast, Midwest and Great Plains – projections for these regions indicate that 30% more precipitation will fall in very heavy rain events relative to the 1901-1960 average (Karl et al. 2009).
- Heavy downpours are increasing nationally, with especially large increases in the Midwest and Northeast (Kunkel et al. 2012, USGCRP 2014). Precipitation intensity (e.g., precipitation per rainy day) is projected to continue to increase by mid-century for most of the U.S. This change is expected even for regions that are projected to experience decreases in mean annual precipitation, such as the Southwest (Kunkel et al. 2012, Wehner 2013, USGCRP 2014).
- The increasing intensity of precipitation events can be expected to lead to more flooding and high flow events in rivers. For example, by the end of the century, New York City is projected to experience almost twice as many days of extreme precipitation that cause flood damage (Ntekos et al. 2010). For the U.S. overall, a recent assessment of flood risks found that the odds of experiencing a 100-year flood are expected to double by 2030 (USGCRP 2014).
- The intensity, frequency and duration of North Atlantic hurricanes has increased in recent decades, and the intensity of these storms is likely to increase in this century (USGCRP 2014).

ADAPTATION OPTIONS

[Click to left of name to check off options for consideration; \\$'s \(\\$-\\$\\$\\$\) indicate relative costs](#)
[Click name of any option to review more information in the Glossary](#)
[No Regrets options - actions that would provide benefits to the utility under current climate conditions as well as any future changes in climate. For more information on No Regrets options, see Page 11 in the Introduction.](#)
[Click on the icon to review the relevant Sustainability Brief.](#)

	PLANNING	COST
<input checked="" type="checkbox"/>	Integrate flood management and modeling into land use planning.	\$
<input type="checkbox"/>	Develop models to understand potential water quality changes (e.g., increased turbidity) and costs of resultant changes in treatment.	\$
<input type="checkbox"/>	Expand current resources by developing regional water connections to allow for water trading in times of service disruption or shortage.	\$\$-\$\$\$
<input type="checkbox"/>	Plan for alternative power supplies to support operations in case of loss of power.	\$
<input type="checkbox"/>	Adopt insurance mechanisms and other financial instruments, such as catastrophe bonds, to protect against financial losses associated with infrastructure losses.	\$
<input type="checkbox"/>	Conduct training for personnel in climate change impacts and adaptation.	\$
<input type="checkbox"/>	Ensure that emergency response plans deal with flooding contingencies and include stakeholder engagement and communication.	\$
<input type="checkbox"/>	Establish mutual aid agreements with neighboring utilities.	\$

ADAPTATION STRATEGIES GUIDE FOR WATER UTILITIES Continued on page 2

Incident Action Checklist – Flooding

The actions in this checklist are divided up into three "tip & run" sections and are examples of activities that water and wastewater utilities can take to: prepare for, respond to and recover from flooding. For on-the-go convenience, you can also populate the "My Contacts" section with critical information that your utility may need during an incident.

Flooding Impacts on Water and Wastewater Utilities

Flooding is common throughout much of the United States and can be caused by heavy precipitation events, storm surge, levee or dam failures or inadequate drainage. These events often occur with little or no notice, and can cause extensive damage to drinking water and wastewater infrastructure. Flooding impacts to utilities often include, but are not limited to:

- Infrastructure damage, possibly resulting in service interruptions
- Pipe breaks due to washouts, which could result in sewage spills or low water pressure throughout the service area
- Debris blockage at an intake or unearthened water and wastewater lines due to falling trees
- Loss of power and communication lines
- Combined sewer overflows (CSOs)
- Water quality changes to source waters and treated effluents, including increased turbidity, increased nutrients and other potential contaminants
- Restricted access to the facility due to debris, flood waters and damage to roadways from washouts and sinkholes
- Loss of water quality testing capability due to restricted facility and laboratory access and damage to utility equipment

The following sections outline actions water and wastewater utilities can take to prepare for, respond to and recover from floods.

- Flood is Predicted
- By stage
- Planning
- Coordination
- Communication
- Personnel
- Power, energy, fuel subsections

Flood Preparedness

Goals R5 Emergency Response

- Increase program flexibility
- Assess programmatic resources/needs
- Develop/ centralize outreach materials
- Outreach
- Increase preparedness for responding under the National Disaster Recovery Framework

Additional Outreach Ideas/Next Steps

Public/Locals/Facilities

- Define high priority geographic focus areas – outreach to state/local EMAs
- Direct outreach to FRP facilities at highest risk
- Outreach to planning areas
- Continue internal planning
 - actions to take in advance of floods
 - additional staff, training, equipment and communication channels needed
 - remediation technique changes that may be needed
 - Continue to review lessons learned
- Continue coordination with other agencies
- Continue core mission training

Flood Preparedness

Goals R5 Emergency Response

- Increase program flexibility
- Assess programmatic resources/needs
- Develop/ centralize outreach materials
- Outreach
- Increase preparedness for responding under the National Disaster Recovery Framework

Figure 1: Organization of the NRF

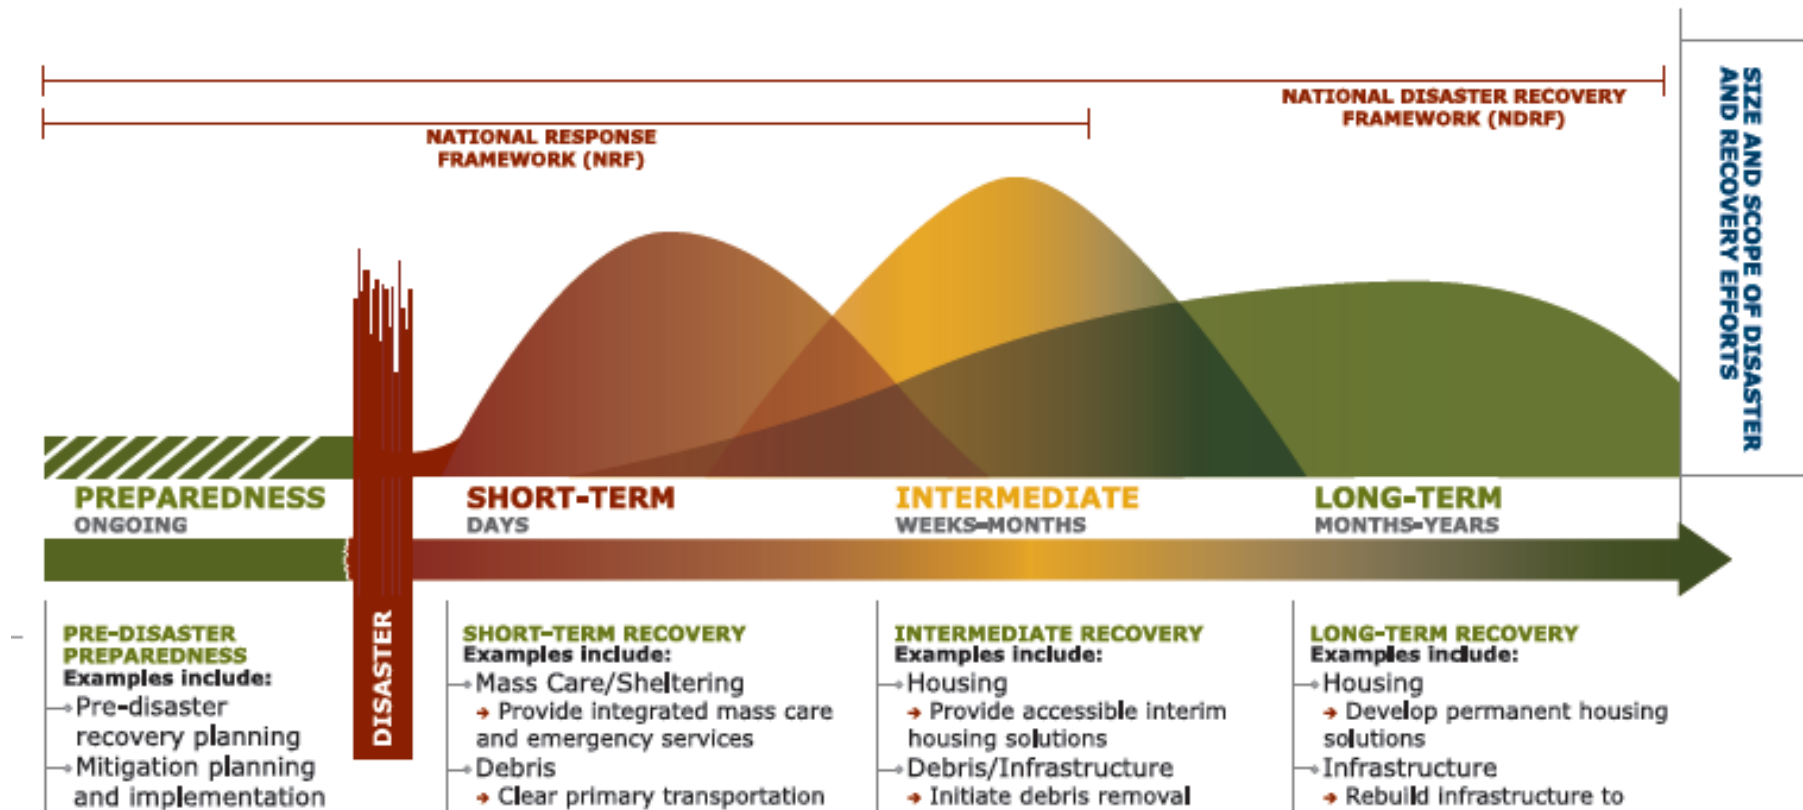

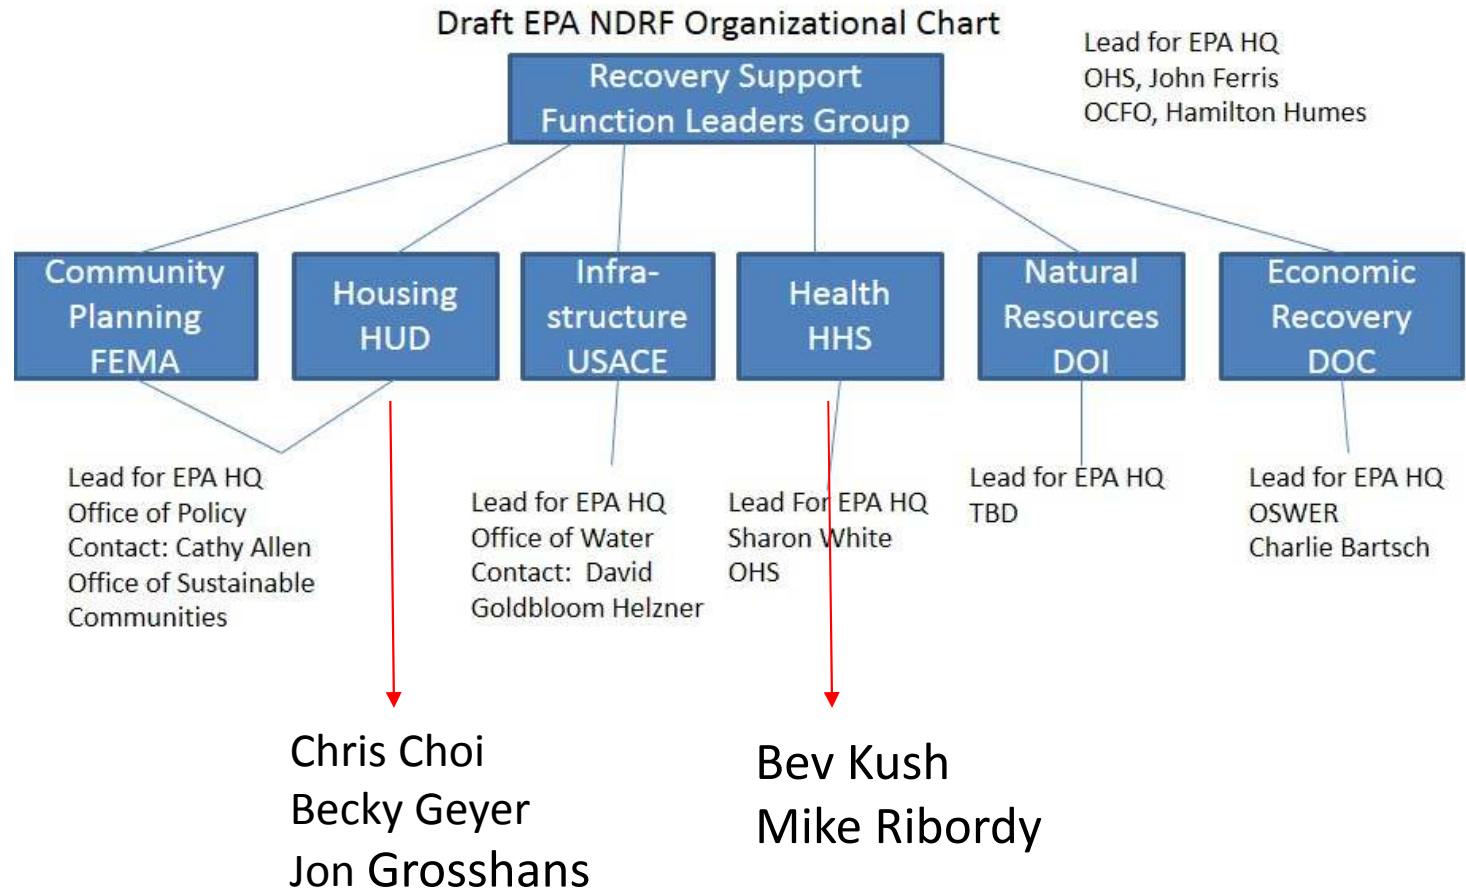

FIGURE 1. RECOVERY CONTINUUM – DESCRIPTION OF ACTIVITIES BY PHASE

NDRF

EPA's Roles in Recovery

NDRF

EPA's Roles in Recovery

- not a COORDINATING Agency for any of the functions
- EPA is a PRIMARY Agency for 2 Functions
 - Health/Social Services
 - Natural and Cultural Resources
- EPA is a SUPPORTING Organization for the other four
- EPA provides assistance when requested by the Coordinating Agency, consistent with their own authorities and resources, or as directed by FEMA.

Flood Preparedness

Goals R5 Emergency Response

- Increase program flexibility
- Assess programmatic resources/needs
- Develop/ centralize outreach materials
- Outreach
- Increase preparedness for responding under the National Disaster Recovery Framework
